TELESCOPIC CONVEYOR BELTS
Telescopic conveyor belts to optimize loading & unloading in warehouses, distribution centres & third party logistic operations

Loading & unloading containers and trailers using Gawronski conveyor belts can increase a dock’s efficiency while improving the safety of both employees and products

Telescopic Conveyor Belts

Our telescopic conveyor belts have been engineered for everyday use and are constructed from robust aluminum.

Using easy to reach controls, the operator is able to move the conveyor forward and backward, control the belt speed and raise and lower the elevating platform. A central control panel houses the direction switch and controls for the LED lighting.

For loading operations where maximizing cube utilization is important, the 36" raised platform height is a real benefit as it allows the operator easy access to the top end of the container when building a box or tire wall.
Proper technique can save both time & energy.

**ALWAYS READY TO USE**

After loading or unloading a container, the Gawronski system can be easily pushed together and moved to another dock door or stored in a space out of the way.

**Advantages**

When compared with organizations using the traditional step stool method of unloading, those using a Gawronski conveyor belt system experience a faster turnaround of trailers/containers and also improve their loading volumes and productivity.

The belts are easy to operate, extremely robust and easy to maintain.
Gawronski GmbH is an innovative company concentrating on material handling in logistics. For over 25 years, we have successfully established ourselves in the marketplace. Today, we are a reliable partner in the development, construction and manufacture of standard and special solutions for customers all over the world.
